

Basket Strainer Installation

1. Before installing the basket strainer, make sure the area surrounding the hole of the sink is clean and completely dry.

2. Use about a handful of plumber's putty and work it to create a ring approximately the same size as the sink's hole. Place the putty around the edge of the sink's hole.

3. Place the strainer through the sink's hole and press into the putty. Wipe away any excess putty above and below the sink with your fingers.

4. From underneath the sink, place the foam washer on the strainer and push all the way up the stem. Then do the same with the rubber washer.

5. Place the locknut on the base of the strainer and screw all the way up the strainer until tight. Do not over-tighten; hand tighten only. You can have someone use a pair of needle-nose pliers to hold the strainer in place from above while you tighten the locknut with your hand.

6. You can now place the basket in the strainer. The lid can then be placed on top of the strainer.
